

To FCC:

I use GPS in a variety of ways personally via phone and automotive use, but my greatest concern is for my many friends and relatives who serve the general public as policemen and emergency workers. They depend on their GPS systems for their own safety and to serve the general public. Lives literally depend on the proper operation of such systems and any unreliable areas of operation could cause one or many to lose life and limb.

Other important interests are the thousands of aircraft that use GPS as a sole means of navigation, not the least important is our own military forces that also use GPS.

I believe that LightSquared's operations and GPS are fundamentally incompatible and that the FCC should not permit LightSquared to use its mobile satellite services frequency for terrestrial broadcast. The DOD and the DOT both have data supporting this position. It would be irresponsible to think that broadband internet use is more important than any of the aforementioned interests. All of the current industries that depend on the proper operation of GPS are no less important than LightSquared's broadband product.

I strongly urge you to not approve LightSquared's request to transmit next to the GPS frequency band.

Respectfully,

Todd A Sorensen
